

Astronaut Takes Blame For Gas In Spacecraft

During a tried attempt to test NASA's new space shuttle, astronaut Eric Freeman was accused of opening the internal gas valve because he heard a hissing noise. (Usually the sound of a split pipe) which can cause fires and killing the passengers (If any) of explosion through gasoline. NASA administrator Kirk Munroe claimed "It was a precaution that had to be put into effect, so no charges will be brought to Eric. Although, he is being held responsible for the spill." Luckily Eric was unharmed as the gas did not light on fire. Chief of Police said "It is reassuring knowing that Eric had the precautionary skills to check the gas valve, but for legal purposes he was a potential threat to the highly expensive shuttle" Police have spoken with the head of NASA and no charges will be held against Eric Freeman. But more immense training will be in effect to prevent further gas problems.
